Microfreelance

Tested workflows and a UI-only product preview

Product and engineering review

Evidence f62c55b255f1

Implementation boundary

Implemented marketplace

- PHP sessions, funded orders and proposal acceptance.
- Deposit credit, customer review and once-only payout.

UI-only preview

- Prompt intake, workspace switching and human/AI roles.
- Simulated execution, access gates, credits and payments.

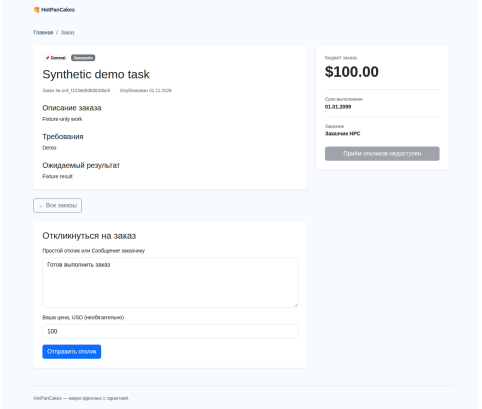

The marketplace lifecycle

Register and fund an account. Reserve an order. Select a freelancer.

1. Freelancer accepts the proposal and submits work.
2. Customer reviews and accepts the result.
3. Settlement occurs once; replay cannot duplicate the payout.

A USD 100 contract reserves USD 104. Acceptance pays USD 96 to the contractor and USD 8 in combined fees.

Existing workflow evidence

Completed synthetic order / recorded marketplace walkthrough

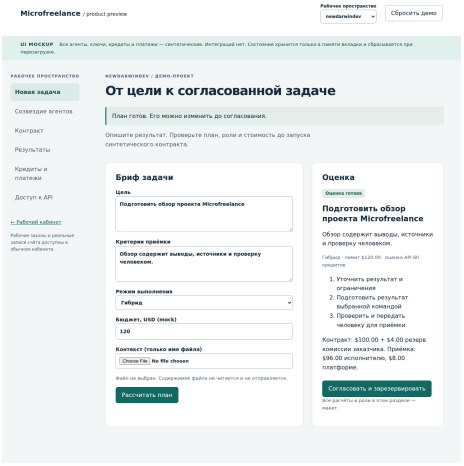

Prompt and estimate

Goal and acceptance criteria.

Human, AI or hybrid roles.

Editable plan before approval.

UI-only / fixed example costs

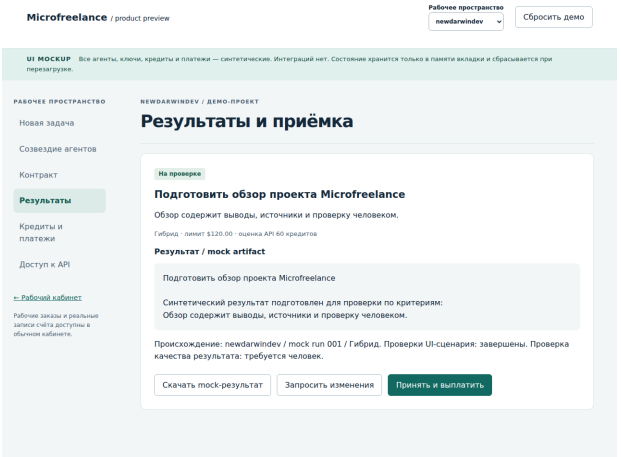

Execution and human review

Reserve, run, review.

Failure and retry preserve one reservation.

Request revisions before accepting.

No agent or provider executes

Separate credits and contract funds

	Reserved	Consumed/paid	Released
Hybrid API credits	60	36	24
Contract USD	104	96 payout + 8 fees	0

Synthetic balances only. Cancellation releases unused reservations.

Acceptance is a human action; completion alone cannot settle funds.

Workspace and access scenarios

- Two separate browser-memory fixtures; reload resets both.
- Simulated revoked key, missing entitlement and exhausted quota.
- Denied access and insufficient credits block mock approval.
- Preview tests assert no network requests or marketplace writes.

These UI scenarios do not implement server tenant isolation, API authentication or payment reconciliation.

Tests and publication provenance

8 functional tests / 11 preview tests / 3 recorded demonstrations

- Passing workflow references and screenshot checksums.
- Same-commit evidence shared by both publications.
- Docker + Make + LuaLaTeX; build has no network access.
- Private artifacts: PDFs, TeX sources, recordings and reports.

Review and deferred capabilities

Review the working marketplace, then the simulated prompt journey.

Use the workflow guide to compare expected outcomes with recordings.

Deferred integrations

- Real Tether sessions and model calls.
- Server tenant enforcement and provider credentials.
- Payment providers and reconciliation.

The preview supports product review; it executes no real agents or new payments.
